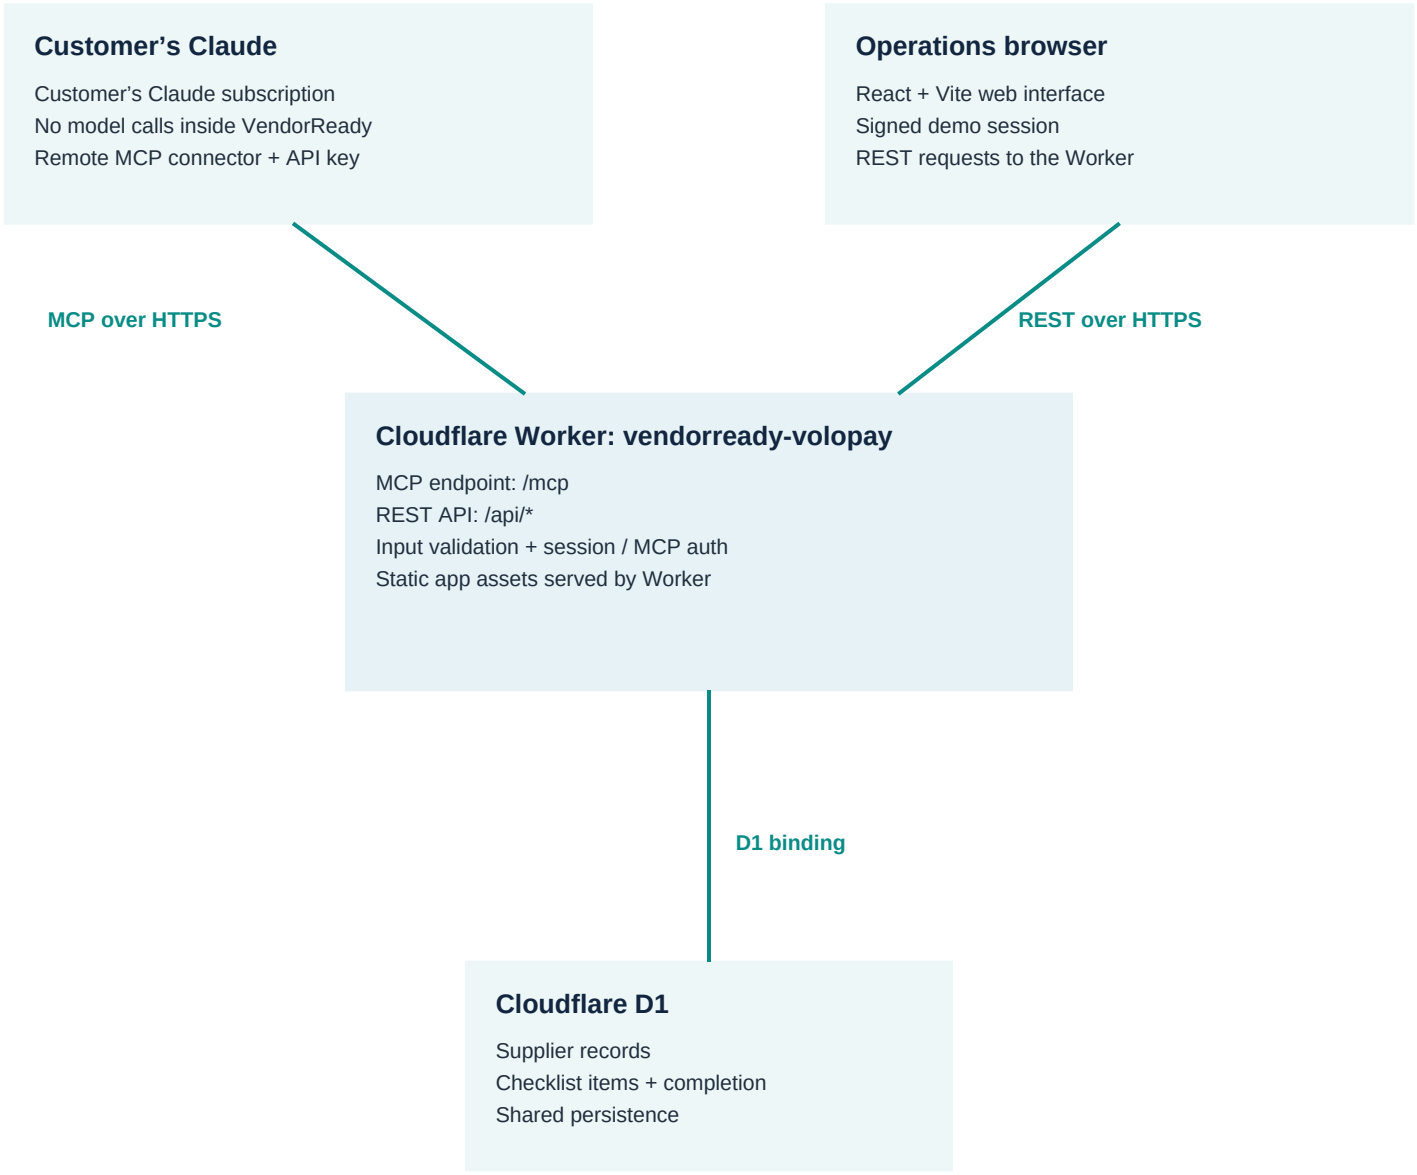
# Architecture

Built prototype: one Cloudflare Worker, one D1 database, one shared demo workspace



Data flow: Claude submits a structured tool call; the Worker authenticates and validates it, then reads or writes D1. The browser uses the Worker REST API to display and edit the same record. A subsequent MCP read returns the persisted state. The browser session and MCP credential are separate controls.

# Implementation Notes

README summary for the assignment reviewer

## Data flow and tools

Built with React, TypeScript and Vite for the browser UI; a Cloudflare Worker hosts the REST API, static assets and remote MCP endpoint; Cloudflare D1 stores onboarding records. GitHub Actions runs checks and a manually confirmed deployment. Claude is an external client using its own account and connector. MCP carries tool requests; it is not a model or payment integration.

## Responsibility boundary: Volopay vs. partner

This is an independent assignment prototype, not a Volopay product integration. The built scope covers the demo workspace, checklist tracking and Claude/MCP interaction. No Volopay production APIs, accounts, payment rails, supplier verification or internal systems are connected. In a proposed partnership, Volopay would define product ownership, customer permissions, risk/compliance policy and any approved finance-system integration; VendorReady would provide workflow UX and integration components only under agreed security, legal and technical review. These are proposed boundaries, not commitments or existing integrations.

## Built vs. proposed production system

Built and verified: create/list/get supplier onboarding through MCP; browser-based editing; D1 persistence; demo login; deployed health endpoint; GitHub Actions deployment. Proposed, not built: tenant-specific identity and authorization, supplier portal, document upload, verification providers, notifications, audit export, billing, ERP/payment integrations, production monitoring and service-level commitments.

## Assumptions and limitations

The demo is a shared fictional workspace and is not appropriate for real personal, tax, banking or supplier-sensitive data. Checklist completion is human-reported and does not prove document validity. Demo credentials and MCP API key are private and are not included here. The app has no AI model API key or inference service. The INR 999/month price is a hypothesis; customer demand, acquisition cost, retention and willingness to pay have not been tested.

## Next steps

Run customer interviews and five design-partner pilots; validate repeat usage and willingness to pay; design tenant isolation and least-privilege access; complete a security/privacy review before handling real data; only then evaluate document intake, notifications and finance integrations. Track the real Claude-to-D1 workflow and human edits as the prototype baseline.

No private credentials are embedded in this PDF. Provide reviewer access only through a secure channel approved by the assignment team.
