Business Strategy

A persistent supplier-readiness workspace, powered by a customer's own Claude

THE IDEA

Turn a plain-language request in Claude into an editable, durable supplier onboarding record shared with the operations team.

Problem

Small businesses collect supplier agreements, registration evidence, contacts and approvals across email, chat and spreadsheets. Requirements get duplicated, status becomes stale, and a useful AI-generated checklist can be lost when a chat ends. Teams need a lightweight source of truth that people can update after the conversation.

Target customer and first use case

Initial customer hypothesis: Indian SMB finance, procurement and operations teams that onboard several suppliers repeatedly but do not need a large procurement suite. The first job is to create a checklist, assign a due date, track completion, and let a human correct the record before the supplier is ready for an internal handoff.

Product and differentiation

The user asks in their Claude account; Claude calls VendorReady over remote MCP. The application validates and stores the supplier and checklist in D1. A manager uses the web app to edit supplier details, requirements and completion status. Claude can retrieve the updated record through MCP. Claude provides reasoning; VendorReady provides persistence, an operational interface and a shared state after chat ends. The app itself makes no model API calls.

Business model and growth potential

Pricing hypothesis for a small-team pilot: INR 999 per organization per month, not validated. Five design-partner pilots would test repeat use and willingness to pay. At 100 paying organizations, the illustrative subscription run rate is INR 99,900 monthly (INR 1,198,800 annualized before costs and taxes); this is a scenario, not a forecast. Customers bring their own Claude subscription. VendorReady would still bear hosting, support, security, payment and acquisition costs.

Acquisition and validation

Start with founder-led outreach to SMB finance and operations leads, then seek referrals from accountants and fractional finance operators. Interview users, observe onboarding workflows, and measure repeated checklist use, time to create a record, completion visibility and willingness to pay. Expand only if pilots show repeat value; test adjacent integrations with customer evidence rather than assuming demand.

Risks and assumptions

Teams may prefer spreadsheets or existing procurement systems. MCP availability and connector policies vary. The current shared demo is not production-grade multi-tenant software. A completed checkbox means a person marked an item complete; it is not legal, tax, identity or bank verification. Pricing and growth figures are unvalidated hypotheses.

Product Execution

Working prototype and verified Claude-to-app workflow

Live links

What is built and demonstrated

A React web dashboard, Cloudflare Worker REST API and remote MCP tools are deployed together. MCP can create, retrieve and list onboarding records. The browser app can search and filter suppliers, edit supplier details and checklist items, and persist changes. Cloudflare D1 stores the same records used by both Claude and the browser. The deployed health endpoint returned ok=true and ai_inside_app=false.

End-to-end test performed

Claude created the fictional Acme Test Supplies record through the VendorReady MCP connector. It appeared in the live dashboard. The checklist was edited in the browser, and Claude subsequently retrieved the record and reported all six items complete. This verifies the actual integration and persistence path, not a mock response.

Simulated, excluded, and access notes

Tax, bank and document checklist entries are fictional placeholders only. The prototype does not verify documents, tax registration or bank ownership; it does not initiate payments, send reminders, upload files, integrate with an ERP or provide tenant isolation. Do not enter real supplier-sensitive data. The demo login and MCP key are private credentials and are intentionally not printed in this document. Share access only through a reviewer-approved secure channel; the submission form warns not to submit passwords.

PRODUCT LINK FIELD

Use the live app URL above for the prototype link and the /mcp URL for MCP. Provide any required private access details only through a secure channel approved by the assignment team.
